## The Catalogue Format

This catalogue of Galactic supernova remnants (SNRs) is an updated version of those presented in detail in Green (1984, 1988) and in summary form in Green (1991) (hereafter Papers I, II, and III respectively). This version contains 182 SNRs (which is 8 more than in the summary catalogue of Paper III and 26 more than in the detailed catalogue of Paper II), with nearly two hundred more references in the detailed listings than in Paper II. For each remnant in the catalogue the following parameters are given:

- **Galactic Coordinates** of the source centroid quoted to the nearest tenth of a degree as is conventional.
- **Other Names** that are commonly used for the object. These are given in parentheses if the remnant is only a part of the source.
- **Right Ascension** and **Declination** of the source centroid. The accuracy of the quoted values depends on the size of the remnant; for small remnants they are to the nearest few seconds of time and the nearest minute of arc respectively, whereas for larger remnants they are rounded to coarser values, but are in every case sufficient to specify a point within the boundary of the remnant. These coordinates are deduced from radio maps rather than from X-ray or optical observations, and are for B1950.0.

- **Angular Size** of the remnant, in arcminutes, usually taken from the highest resolution radio map available, although for some barely resolved sources that are thought to be SNRs the only available size is that from Gaussian models after deconvolution with the observed beam size. The boundary of most remnants approximates reasonably well to a circle or an ellipse; a single value is quoted for the angular size of the more nearly circular remnants, which is the diameter of a circle with an area equal to that of the remnant, but for elongated remnants the product of two values is quoted, and these are the major and minor axes of the remnant boundary modelled as an ellipse. In a few cases an ellipse is not a satisfactory description of the boundary of the object (refer to the description of the individual object given in its catalogue entry), although an angular size is still quoted for information. For 'filled-centre' remnants the size quoted is for the largest extent of the observed radio emission, not, as at times has been used, the half-width of the centrally brightened peak.
- **Flux Density** of the remnant at 1 GHz in jansky. This is *not* a measured value, but that deduced from the observed radio frequency spectrum of the source. The frequency of 1 GHz is chosen because flux density measurements at frequencies both above and below this value are usually available.
- **Spectral Index** of the integrated radio emission from the remnant,  $\alpha$  (here defined in the sense,  $S \propto \nu^{-\alpha}$ , where  $S$  is the flux density at a frequency  $\nu$ ), either a value that is quoted in the literature, or one deduced from the available integrated flux densities of the remnant. For several SNRs a simple spectral model is not adequate to describe their radio emission because there is evidence that the spectral index varies across the face of the remnant or that the integrated spectrum is curved, and in these cases the spectral index is given as 'varies' (refer to the description of the remnant and recent references in the catalogue entry for more information). In a few cases, where the remnant is highly confused with thermal emission, the spectral index is given as '?' since no value can be deduced with any confidence.
- **Type** of the SNR, either 'S', 'F' or 'C' if the remnant shows a 'shell', 'filled-centre' or 'composite' (or 'combination') radio structure (or 'S?', 'F?' or 'C?', respectively, if there is some uncertainty), or '?' in several cases where an object is conventionally regarded as an SNR even though its nature is poorly known or not well understood.

Then, for each remnant, notes on a variety of topics are given. First, it is noted if other Galactic coordinates have at times been used to label it (usually before good observations have revealed the full extent of the object), if the SNR is thought to be the remnant of a historical SN, or if the nature of the source as an SNR has been questioned (in which case an appropriate reference is usually given later in the entry). Brief descriptions of the remnant from the available radio, optical and X-ray observations as applicable are then given, together with notes on available distance determinations, and any point sources or pulsars in the field of the object (although they may not necessarily be related to the remnant). Finally, appropriate references are given for each remnant, complete with journal, volume, page, and a short description of what information each paper contains (for radio observations these include the telescopes used, the observing frequencies and resolutions, together with any flux density determinations). These references are *not* complete, but cover representative and recent observations of the remnant, and they should themselves include references to earlier work. The references do not generally include large observational surveys — of particular interest in this respect are: the Effelsberg 100-m survey at 2.7 GHz of the Galactic plane  $358^\circ < l < 240^\circ$ ,  $|b| < 5^\circ$  by Reich *et al.* (1990) and Fürst *et al.* (1990); the review of Einstein X-ray imaging and FPCS observations of Galactic SNRs by Seward (1990) and Lum *et al.* (1992) respectively; the survey of IRAS observations of SNRs and their immediate surroundings by Arendt (1989) and by Saken, Fesen & Shull (1992); and the survey of HI emission towards SNRs by Koo & Heiles (1991).

A summary of the data available for all 182 remnants in the catalogue is given in Table I. SNRs often called by names other than their Galactic coordinates are listed alphabetically in Table II, and the abbreviations for journals, proceedings and telescopes (both radio and X-ray) used here are listed in Table III. The detailed listings for each SNR are given in Table IV.

## Revisions and Notes

### *Objects no longer thought to be SNRs*

The following objects, which were listed in the catalogue in Paper I, have been removed from the catalogue because they are no longer thought to be remnants, or are poorly observed (see Paper II for references and further details): G2.4+1.4, G41.9-4.1 (=CTB 73, PKS 1920+06), G47.6+6.1 (=CTB 63), G53.9+0.3 (part of HC40), G93.4+1.8 (=NRAO 655), G123.2+2.9, G194.7+0.4 (the Origem Loop), G287.8-0.5, G322.3-1.2 (=Kes 24) and G343.0-6.0.

G350.1-0.3, which was listed in the catalogue in Paper II, was removed as it is no longer thought to be a SNR (see Paper III for details). No objects listed in the catalogue in Paper III have since been removed.

The following objects, which have been reported as SNRs, but have not been included in any of SNR catalogues, have subsequently been shown not to be SNRs:

- G70.7+1.2 which was reported as a SNR by Reich *et al.* (1985), but this has not been confirmed by subsequent observations (see Green 1986; de Muizon *et al.* 1988; Becker & Fesen 1988; Caswell 1988; Bally *et al.* 1989).
- G81.6+1.0 a possible SNR in W75 reported by Ward-Thompson & Robson (1991) is instead a thermal source, because of its thermal radio spectrum, and high infrared-to-radio emission (see the observations in Wendker, Higgs & Landecker 1991).
- Green & Gull (1984) suggested that G227.1+1.0 as a very young SNR, but subsequent observations (Channan *et al.* 1986; Green & Gull 1986) have shown that this is most likely an extragalactic source, not an SNR.
- a candidate SNR, G274.7-2.8, identified by Helfand & Channan (1989), has been shown not to be a SNR by Caswell & Stewart (1991).
- G25.5+0.2, which was reported as a very young SNR by Cowan *et al.* (1990), although this identification was not certain (see White & Becker 1990; Green 1990; Zijlstra 1991). Sramek *et al.* (1992) report the detection of recombination lines from this source.
- Most of the possible SNRs listed by Gorham (1990) have been shown not to be SNRs by Gorham *et al.* (1993).

Some entries in the catalogue have been renamed, due to improved observations revealing a larger true extent for the object (G5.3-1.0 is now G5.4-1.2; G193.3-1.5 is now G192.8-1.1; G308.7+0.0 is now G308.8-0.1).

### New SNRs

The following new remnants were added to the catalogue of Paper II: G0.9+0.1, G1.9+0.3, G5.9+3.1, G6.4+4.0, G8.7-0.1, G16.8-1.1, G18.9-1.1, G20.0-0.2, G27.8+0.6, G30.7+1.0, G31.5-0.6, G36.6-0.7, G42.8+0.6, G45.7-0.4, G54.1+0.3, G73.9+0.9, G179.0+2.6, G312.4-0.4, G357.7+0.3 and G359.1-0.9.

The following new remnants were added to the catalogue of Paper III: G4.2-3.5, G5.2-2.6, G6.1+1.2, G8.7-5.0, G13.5+0.2, G15.1-1.6, G16.7+0.1, G17.4-2.3, G17.8-2.6, G30.7-2.0, G36.6+2.6, G43.9+1.6, G59.8+1.2, G65.1+0.6, G68.6-1.2, G69.7+1.0, G279.0+1.1, G284.3-1.8 (=MSH 10-53), G358.4-1.9 and G359.0-0.9.

Since Paper III, the following SNRs have been added to the catalogue:

- Three new remnants (G59.5+0.1, G67.7+1.8 and G84.9+0.5) of the eleven possible SNRs reported by Taylor, Wallace & Goss (1992).
- G156.2+5.7, which was first identified from X-ray observations by ROSAT (Pfeffermann, Aschenbach & Predehl 1991).
- G318.9+0.4, a complex of radio arcs reported by Whiteoak (1990).
- G322.5-0.1, reported by Whiteoak (1992).
- G343.1-2.3, an incomplete radio shell, with an associated pulsar (McAdam, Osborne & Parkinson 1993).
- G348.5-0.0, a radio arc near G348.5+0.1 (=CTB 37A), revealed by Kassim, Baum & Weiler (1991).

### Possible SNRs not listed in the catalogue

The following are possible SNRs for which further observations are required to confirm their nature.

- Eight possible remnants (G45.9-0.1, G55.2+0.5, G63.7+1.1, G71.6-0.5, G72.2-0.3, G76.9+0.9, G83.0-0.2 and G85.2-1.2) of the eleven reported by Taylor *et al.* (1992).
- G287.6-0.6 and G343.0-6.0 — both of which were listed in Paper I as SNRs but have been removed from the catalogue because only limited observations are available — should be considered as possible SNRs (see Tateyama, Strauss & Kaufmann 1991 for G287.6-0.6).
- G284.2-1.8 (=MSH 10-53), which was listed in early SNR catalogues, but subsequently rejected because of its apparent thermal spectrum (see Paper II for details). Ruiz & May (1986) report optical and CO radio observations that indicate the presence of shock-excited material, supporting the SNR identification, although the parameters of any SNR are not well defined.
- A possible SNR within the Puppis A remnant (Winkler *et al.* 1989).
- G300.1+9.4, a possible SNR reported by Dubner, Colomb & Giacani (1986).
- G203.2-12.3, a filamentary optical ring identified as a SNR by Winkler & Reipurth (1992).
- G315.8-0.0, a possible 'shell' SNR with a remarkable collimated 'jet' of radio emission, reported by Kesteven *et al.* (1987), although this source has an unusually steep spectrum (with  $\alpha \approx 1$ ).
- A possible SNR near  $l = 32^\circ$  reported by Thompson, Djorgovski & Decarvalho (1991).
- A faint, poorly defined possible remnant G41.1+1.2 reported by Gorham *et al.* (1993).
- A possible large SNR in Lupus near  $l = 347^\circ$ ,  $b = 22^\circ$  (Reigler, Agrawal & Gull 1980; Colomb, Dubner & Giacani 1984).
- G1.0-0.1, a possible SNR near the Galactic centre reported by Downes *et al.* (1978).
- G75.5+2.4, a possible old SNR in Cygnus (Nichols-Bohlin & Fesen 1993).

Other possible SNRs are reported by Ho *et al.* (1985), Gosachinskiy (1985), Odegard (1986), Fürst, Reich & Sofue (1987), Routledge & Vaneldik (1988), Kassim (1988), Helfand *et al.* (1989), Meaburn *et al.* (1991), Leahy, Nousek & Garmire (1992), and Dubner *et al.* (1992).

Finally, it should be noted that some radio loops in the Galactic plane (see Berkhuijsen 1973) may be parts of very large, old SNRs, but they have not been included in the catalogue.

### Questionable SNRs listed in the catalogue

As noted in Paper II, the following sources are listed in the catalogue as SNRs, although, as discussed in each case, the identifications are not certain: G5.4-1.2, G39.7-2.0 (=W50), G65.7+1.2 (=DA 495), G69.0+2.7 (=CTB 80), G357.7-0.1. The nature of G318.9+0.4 is also uncertain (see Whiteoak 1990).

There are also many objects that have been identified as SNRs and are listed in the catalogue, although they have been barely resolved in the available observations, or are faint, and have not been well separated from confusing background or nearby thermal emission, and their identification as SNRs, or at least their parameters remain uncertain (see Paper II).

**Journals**

AA	Astronomy & Astrophysics
AAS	Astronomy & Astrophysics Supplement
AJ	Astronomical Journal
AJP	Australian Journal of Physics
AJPAS	Australian Journal of Physics Astrophysical Supplement
AL	Astrophysical Letters
ApJ	Astrophysical Journal
ApJS	Astrophysical Journal Supplement
JAA	Journal of Astrophysics & Astronomy
JRASC	Journal of the Royal Astronomical Society of Canada
MN	Monthly Notices of the Royal Astronomical Society
PASA	Proceedings of the Astronomical Society of Australia
PASJ	Publications of the Astronomical Society of Japan
PASP	Publications of the Astronomical Society of the Pacific
RMex	Review of Mexican Astronomy & Astrophysics
SA	Soviet Astronomy
SAL	Soviet Astronomy Letters

**Proceedings**

- IAU101 is *Supernova Remnants and their X-ray Emission*, (IAU Symposium 101), eds Danziger, I.J. & Gorenstein, P., (Reidel, Dordrecht, Holland), 1983.
- SNRISM is *Supernova Remnants and the Interstellar Medium*, (IAU Colloquium 101), eds Roger, R.S. & Landecker, T.L., (Cambridge University Press), 1988.
- Birthevents is *Supernova Shells and their Birth Events*, ed. Kundt, W.R. (Springer-Verlag, Berlin) 1988.

**Telescopes: Radio**

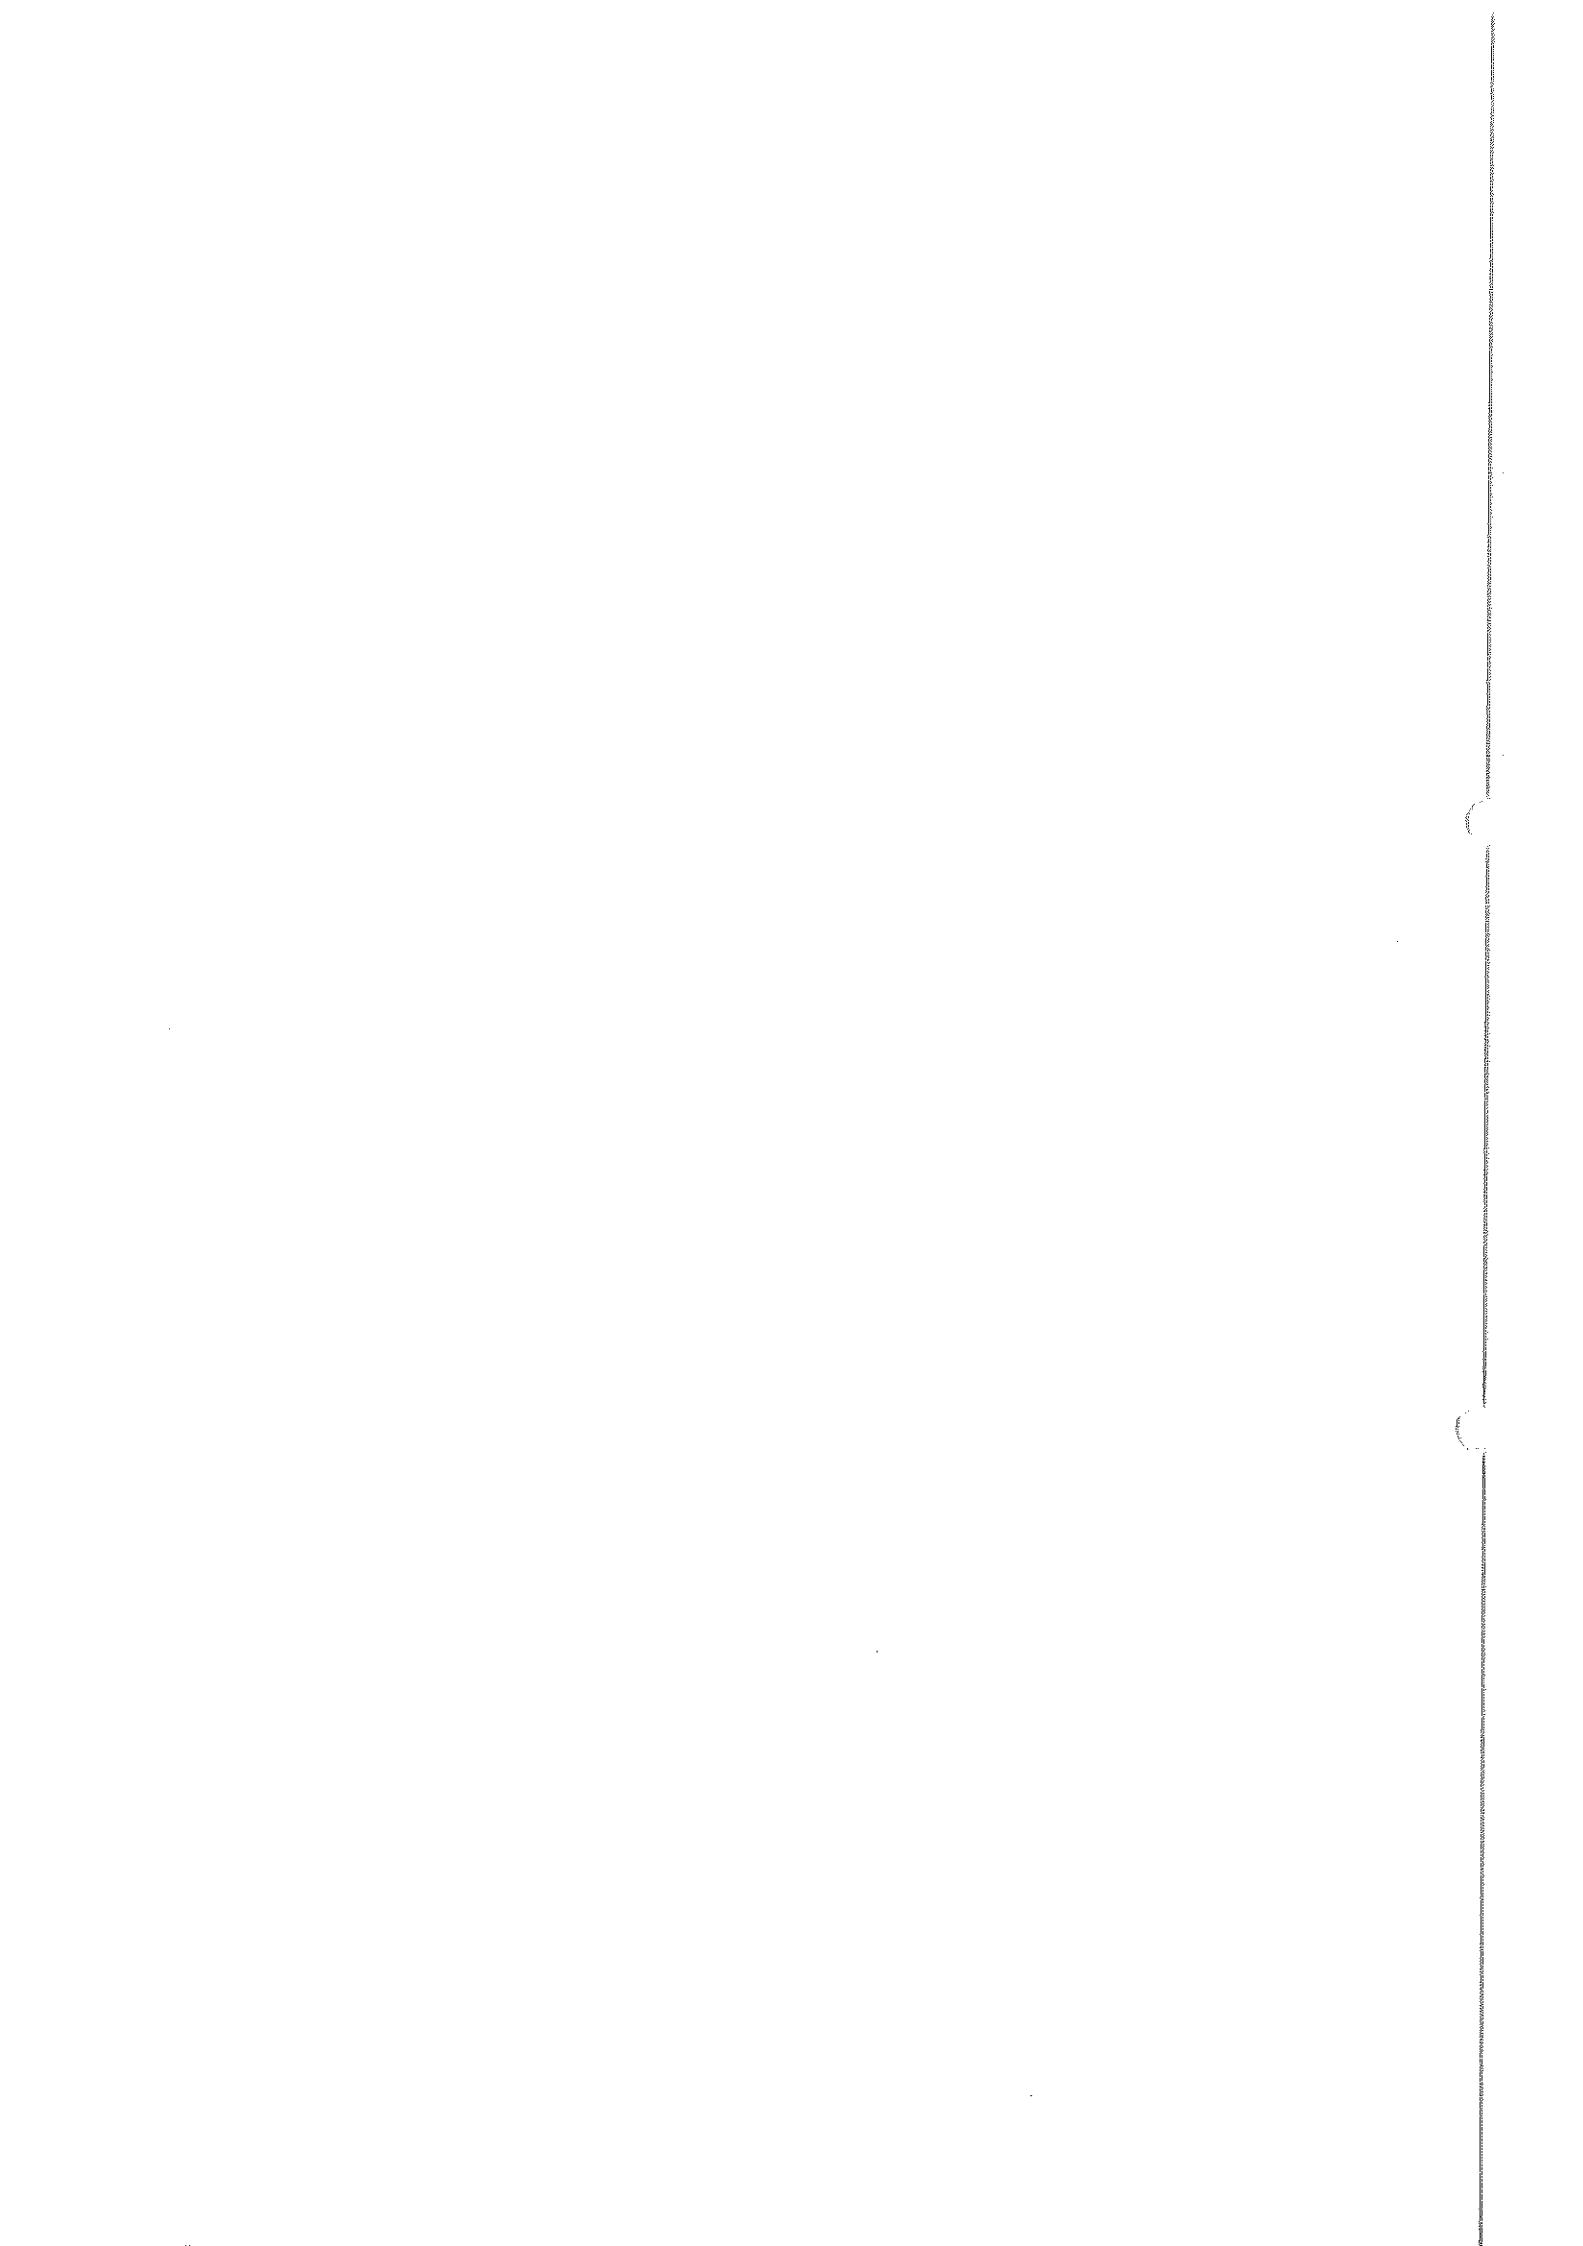

5km	Cambridge 5-km Telescope
6C	Cambridge low frequency northern survey
CLFST	Cambridge Low Frequency Synthesis Telescope
DRAO	Dominion Radio Astrophysical Observatory
FIRST	Fleurs Synthesis Telescope
GEETEE	Gauribidanur 'T' array
HMT	Cambridge Half-Mile Telescope
MOST	Molonglo Observatory Synthesis Telescope
NRAO	National Radio Astronomy Observatory
NRO	Nobeyama Radio Observatory
OMT	Cambridge One-Mile Telescope
OSRT	Ooty Synthesis Radio Telescope
TPT	Clark Lake TPT telescope
VLA	Very Large Array
VRO	Vermillion River Observatory
WSRT	Westerbork Synthesis Radio Telescope

**Telescopes: X-ray**

- EXOSAT European X-ray Observatory Satellite  
 ROSAT Röntgensatellit

**On board Einstein (HEAO-2)**

FPCS	Focal Plane Crystal Spectrometer
HRI	High Resolution Imager
IPC	Imaging Proportional Counter
SSS	Solid State Spectrometer

**G0.0 + 0.0**

RA:  $17^{\text{h}}42^{\text{m}}33^{\text{s}}$   
 Dec:  $-28^{\circ}59'$

1-GHz flux (Jy): 100?  
 Spectral index: 0.8?

Size (arcmin):  $3.5 \times 2.5$   
 Type: S

**Radio:** Non-thermal shell, in complex region, interacting with molecular material to the west.

**References:**

- Ekers *et al.* 1983, AA, 122, 143. VLA at 1.4 GHz and 5 GHz (both  $5'' \times 8''$ ),  $S(1.4) = 77$ ,  $S(5.0) = 31$ .  
 Pedlar *et al.* 1989, ApJ, 342, 769. VLA at 332 MHz ( $12''$ ), 1.4 GHz ( $1''.3 \times 2''.5$ ) and 5 GHz ( $1''.3 \times 2''.5$ ).

**G0.9 + 0.1**

RA:  $17^{\text{h}}44^{\text{m}}12^{\text{s}}$   
 Dec:  $-28^{\circ}08'$

1-GHz flux (Jy): 18?  
 Spectral index: varies

Size (arcmin): 8  
 Type: C

**Radio:** Flat spectrum core within steep spectrum shell.

**X-ray:** Possibly detected.

**References:**

- Helfand & Becker 1987, ApJ, 314, 203. VLA at 1.4 and 5 GHz, and IPC observations.

**G1.9 + 0.3**

RA:  $17^{\text{h}}45^{\text{m}}37^{\text{s}}$   
 Dec:  $-27^{\circ}09'$

1-GHz flux (Jy): 0.6  
 Spectral index: 0.7

Size (arcmin): 1.2  
 Type: S

**Radio:** Shell, brighter to the N.

**References:**

- Green & Gull 1984, Nature, 312, 527. VLA at 5 GHz ( $4''.4 \times 2''$ ).

**G4.2 – 3.5**

RA:  $18^{\text{h}}05^{\text{m}}45^{\text{s}}$   
 Dec:  $-27^{\circ}04'$

1-GHz flux (Jy): 3.2?  
 Spectral index: 0.6?

Size (arcmin): 28  
 Type: S

**Radio:** Elongated shell.

**G4.5 + 6.8**

**R.A:** 17<sup>h</sup>27<sup>m</sup>42<sup>s</sup>  
**Dec:** -21°27'

**1-GHz flux (Jy):** 19  
**Spectral index:** 0.64

Kepler, SN1604, 3C358

**Size (arcmin):** 3  
**Type:** S

This is the remnant of Kepler's SN of AD1604.

**Radio:** Incomplete shell, brighter to the N.

**Optical:** Faint filaments.

**X-ray:** Shell, brighter to the N.

**Distance:** Historical observations indicate about 4.4 kpc.

**G5.2 - 2.6**

**R.A:** 18<sup>h</sup>04<sup>m</sup>25<sup>s</sup>  
**Dec:** -25°45'

**1-GHz flux (Jy):** 2.6?  
**Spectral index:** 0.6?

**Size (arcmin):** 18  
**Type:** S

**Radio:** Poorly resolved shell.

**References:**

- Reich *et al.* 1988, in SNRISM, p293. Summary of parameters.  
 Reich *et al.* 1990, AAS, 85, 633. Effelsberg 100-m at 2.7 GHz (4'.3).

**G5.4 - 1.2**

Milne 56

**R.A:** 17<sup>h</sup>59<sup>m</sup>00<sup>s</sup>  
**Dec:** -24°55'

**1-GHz flux (Jy):** 35?  
**Spectral index:** 0.2?

**Size (arcmin):** 35  
**Type:** C?

Part been called G5.3-1.0. Has been suggested that this is not a SNR.

**Radio:** Incomplete shell, including wide "v" of emission to east with small flat-spectrum source at apex.

**Optical:** Detected.

**Point sources:** Pulsar associated with flat spectrum source.

**G5.9 + 3.1**

**RA:** 17<sup>h</sup>44<sup>m</sup>20<sup>s</sup>  
**Dec:** -22° 15'

**1-GHz flux (Jy):** 3.3?  
**Spectral index:** 0.4?

**Size (arcmin):** 20  
**Type:** S

**Radio:** Asymmetric shell.

**References:**

Reich *et al.* 1988, in SNRISM, p293. Effelsberg 100-m at 2.7 GHz (4'.3).

**G6.1 + 1.2**

**RA:** 17<sup>h</sup>51<sup>m</sup>55<sup>s</sup>  
**Dec:** -23° 05'

**1-GHz flux (Jy):** 4.0?  
**Spectral index:** 0.3?

**Size (arcmin):** 30 × 26  
**Type:** F

**Radio:** Faint, diffuse emission.

**References:**

Reich *et al.* 1988, in SNRISM, p293. Summary of parameters.

Reich *et al.* 1990, AAS, 85, 633. Effelsberg 100-m at 2.7 GHz (4'.3).

**G6.4 - 0.1**

W28

**RA:** 17<sup>h</sup>57<sup>m</sup>30<sup>s</sup>  
**Dec:** -23° 25'

**1-GHz flux (Jy):** 310  
**Spectral index:** varies

**Size (arcmin):** 42  
**Type:** C

Has been called G6.6-0.2.

**Radio:** Several non-thermal sources in a ring, with flat spectrum core.

**Optical:** Filaments.

**X-ray:** Diffuse emission from most of the remnant.

**Point sources:** Compact X-ray source near centre.

**Distance:** Uncertain mean optical velocity indicates 3.5–4 kpc.

**References:**

**G184.6 – 5.8**

Crab Nebula, 3C144, SN1054

**R.A:** 05<sup>h</sup>31<sup>m</sup>30<sup>s</sup>  
**Dec:** +21°59'

**1-GHz flux (Jy):** 1040  
**Spectral index:** 0.30

**Size (arcmin):** 7 × 5  
**Type:** F

This is the remnant of the SN of AD1054.

**Radio:** Filled-centre, central pulsar, with faint “jet” (or tube) extending from the N edge.

**Optical:** Strongly polarized filaments, diffuse synchrotron emission, with “jet” faintly visible.

**X-ray:** Centrally brightened around the pulsar.

**Point sources:** Pulsar powering the remnant.

**Distance:** Proper motions and radial velocities give 2 kpc.
